

CI/CD for E3 Deployment

E3 Deployment, can be done using Auto RFC or manual RFC.

Auto RFC can be used for changes which do not require any approval and Manual RFC is required, if approval is required.

For CRR, we are taking Manual RFC approach as every change should go through approval process.

Required changes in the workflow has been embedded in workflow named deploy-to-hydra.yml, for all repositories for e3 deployment.

<https://github.aexp.com/amex-eng/crr-rule-configurer/blob/develop/.github/workflows/deploy-to-hydra.yml>

To create RFC, we can follow below incident [CHG014867706](#) with required details as below

Attribute	Value
Configuration item	AML Customer Risk Rating - E3-Production
Assignment group	GCIP_AML_CRR

Once, we have RFC created, we can go to repository->ActionsDeploy To Hydra-E2/E3 and trigger E3 deployment using Run workflow manually.

Use below details to Run workflow manually

Attribute	Value
Branch	main
CHG Number(RFC)	Manually created RFC
Operation	Deploy an image
environment	e3

Once workflow is successful, verify the deployment and close the RFC.
