

How Tos

LifeCycle	Facts to Know Before Onboarding New Feeds on Lumi from any Source : Pre-Requisite : 1. LDOT & EDM Approval / DT Logic readiness	
1	Pipeline is a set of instructions and processes for ingesting the data from the sources to warehouse .	
	• Get the approval of EDM / DT Logic readiness.	• Enablement team & UseCase Team

2	Metadata	
	Submitting Pipeline & get Approval	
	- Create a Pipeline - Get approval of metadata template from the lumi first team.	Changes need to be done by the Enablement team.
3	Lumi first team is going to Review, Prioritize & Create Jira Ticket.	
	Teams need to create the Jira ticket in order to assign ticket to lumi first team.	Lumi first team is going to work on the tickets that is raised by the respective teams. Lumi first team is going to decide the priority of the ticket.
4		
	Lumi first team is going to create the pipeline and register the metadata.	Verification of metadata is done in the 3rd step itself. Now the lumi team will go to create the pipeline for ingesting the data in the warehouse.
5		
	User Case team will do the sample ingestion and validate whether the data is coming in the proper format or not.	If any issue arises while doing the validation application team will reach out to the lumi first team. Before reaching out to the lumi first team, application team need to create a Jira ticket and assign to the lumi first team.
5		
	Once the application team verifies the details of the data ingestion result and gives their confirmation, lumi first team can go and push their code on production environment.	Lumi first team needs the confirmation from the User Case team and Enablement team before proceeding to push the pipeline into the production environment(E1).

Data Migration from Cornerstone to LUMI

The journey of use case enablement involves collaboration among multiple teams and stakeholders, encompassing activities from discovery phase and architecture design approval to project provisioning, platform readiness checks and user onboarding. This section outlines the high-level activities conducted in both Pre-onboarding and Post-onboarding of Lumi use-case project.

Pre - Onboarding Phase

Pre-onboarding activities consists all the steps needed to execute on the expectations set during the Discovery Phase. It encompasses everything from ARB approval to handover of the project to use case teams.

Architecture Review Board (ARB) Approval Process

Step 1:

The ARB review process begins when a Use Case team submits their Use Case through the intake form. Portal. During this step the requestor will need to provide all relevant information about their Use Case; including scope, goals, expected output, and any other relevant details.

Step 2:

After the requestor has submitted their Use Case request, the ARB team will schedule a call for initial approval. During this call the team will review the necessary artifacts together with the Use Case team to determine if it meets the platform guidelines and verify that the Use Case does not pose any risk or security threats.

Once approved, the Use Case teams will receive notification of initial approval and set-up of access to the E1 and E2 environments will begin. *(Timeline for environment provisioning is approximately 2-4 weeks)*

Step 3:

Once E2 testing and implementation are completed, the Use Case team can request a secondary ARB signoff to receive limited access deploy their Use Case code to the E3 environment.

Before requesting secondary approval, the Use Case team should ensure that any ARB proposed changes are implemented. **All recommendations and action items must be completed prior to final approval.** Any changes to architecture or delivery stack not noted / approved by ARB will delay final ARB signoff and E3 environment provisioning.

Step	Task	Pre-Requisites	Inputs	Outcomes
1	ARB Submission	Access to Lumi	n/a	n/a
2	ARB Review(1st check point)	• Use Case onboarding request submitted • Scope and solution envisioned	• Use Case details and description • Technical documents outlining Use Case scope, goals, and expected output • SLA/SLO details • Techstack details • Process Flow	• ARB decision • Recommendations on Architecture • Recommendations on Capacity • E1 and E2 can be provisioned after this
3	ARB Signoff(2nd Check point)	• E1/E2 environment provisioned • E1 testing and validation is completed • Use Case team implements the recommendations provided by ARB • All the approvals from portal are completed	• Updated Architecture flow as per ARB's recommendation • issues/concerns Use-case team noticed in E1 /E2	• ARB signoff • Approval for E3 provisioning • Recommendations on capacity for E3

For Cornerstone to lumi migration, once the Lumi team, starts the migration, use-case team can validate their SOR Tables on the respective Lumi Environment.

Prerequisites for project access

1. General Google Cloud Platform prc group access
2. Provisioned use case project with proper enabled services.
3. Project level prc group access for use case project.

Steps to get PRC Group Access

1. Navigate to IIQ (<https://iiq.aexp.com/iam/home.jsf>) "Request Access."
2. Use the IIQ PRC Group name provided by the Lumi Platform Team to request access to that PRC group for your ads id.
3. Your access will be finalized after IIQ request is approved.
