

Sprint Refinements

Date	Agenda	MoM (Discussions & Alignments with Business)	Comments
23 Jan 2025	POD & POA Sync for CRR Scoring	- The scoring methodology would be to calculate CRR score at a Customer Level. - In case where there is a requirement for Account Score, the score of the Customer linked to that account would be shared. - Account Hierarchy Scoring and Customer Final Scoring (comparison of the customer score with the account hierarchy score and assigning the max of that) won't be required. The customer score would be propagated for all these score requirements. - Prohibited Scoring would happen at customer level now and it would only be applicable for the existing DataPoints (15 & 501). - EDD scheduling would also utilise the Customer Score for use cases where account score is required. - Tommy and team are discussing to replace the Systematic HRO/ARFs with CRR rules. - Manual HRO would be required as part of POA CRR and they would be applicable at the customer level. - For CADENCE non core capabilities (like PEP/SIP) product should start finding the destination in POA GCIP. - In POD, CADENCE generates CUST_ID for ACCTs for which CUST_ID is not received from SOR. Tommy mentioned in such cases only a single Acct score would contribute to that customer score, internally tech needs to decide how can this be tackled, because as per initial discussions with DAM there is no concept of generating a CUST_ID. - A sync from POD to POA would be required in case of score mitigation after a review. - Also it was discussed that it would be better to enable CRR & EDD together (or within short gap) in GCIP to avoid these sync issues. This would be needed to discussed further with wider audience.	
29 Jan 2025	Discussion on Open Items	- Cross Centered Customer Scoring : Need to design a logic to score customers based on priority of centres. This priority would be maintained by Business Team. - If there are 2 Customers linked to same account the customer score of the direct account holder(AH) gets propagated as the account score. - The corporate accounts linked to any customer should be scored separately from their corresponding consumer accounts. For Individual scoring only the individual products should be considered. Today we have CPLI_RISK_MTHD_CD column which specifies if the product is individual or entity, something similar would be required in POA, need to check with DAM on this. - Tommy is working identifying the BIA Tier for POA CRR application. Below pages will be reviewed in the upcoming sessions- CRR BAU Rules - Existing Rule Flow CRR Proposed Rules - CRR Rules Proposed Flow CRR Scoring Triggers - CRR Scoring Triggers	
05 Feb 2025	Discussion on the 5 Different scoring approaches	- Reviewed all the 5 different scoring approaches at a high level with Tommy. - In order for us to decide on the frequency for the time based rule, we need to have coordination between DAM and CRR for the data refresh. Like For transaction rules, we need to have the understanding that exactly when does the dam data gets refreshed for their monthly roll ups. - There was an alignment with Tommy to have a checkbox on the UI to indicate if a rule needs to be considered as time-based in order to make it more scalable across CRR. The frequency would be set as monthly for the time based rules. For the sandbox triggers, we just need to rescore those element ids, that have been updated as part of the sandbox creation pertaining to a specific market. So, sandbox triggers is like a subset to the rule based triggers for a specific market. Later confirmed by Satvik, that Jake wants to run all the Risk Elements when a SBX is submitted. Also mentioned in Feature - F716860: CRR - Execution and Build of Sandbox and Simulation - We will be having a requirement of generating CRR stats after every sandbox execution and where the results for the same should be published, is still under discussions. Confirmation on the same is still awaited. - Tommy is still evaluating Centre vs market approach for CRR, he mentioned we might have an answer in 1-2 weeks. - Discussed the frequency and anticipated volumes for each of the scoring triggers which will help us to determining the integration pattern with DAM. - Periodic Scoring will happen if a customer is not risk scored for a period of 4 months via any of the scoring triggers (like Event/Time/Risk Element Change).	

12 Feb 2025	Customer Scoring : Max Rule Logic	- Discussed regarding Ratio Rule : Ratio rules need not to be made dynamic as they are very specific and in the future also there is no use case to add other DPs with it. - Walked through the Existing Customer Max Scoring Logic. Also discussed the proposed approach for Dynamic Scoring Logic for Customer Max Rules. - Individual customer scoring : Today we consider only accounts with AH/JH Role for Customer Scoring, need to discuss and refine on this further. - Some of the transaction rules that use max logic, would need to be rebuilt using the customer level aggregation. Following points were discussed in the call with CoE Team, adding them here for documenting them- - For individual / Entity scoring – Legal Entity should be included, similar to what we are doing for Obligor Scoring in BAU. - Scenario : If 2 customers are linked to a single account (basic/supp relationship), in the following example A2 is linked with C1 & C2, then if the account score for A2 is required, in this case, customer (C2) who is the owner of the card its score would be propagated. <table><tr><td>A1</td><td>C1</td><td>Basic</td></tr><tr><td>A2</td><td>C1</td><td>Supp</td></tr><tr><td>A3</td><td>C1</td><td>Supp</td></tr><tr><td>A4</td><td>C1</td><td>Supp</td></tr><tr><td>A5</td><td>C1</td><td>Supp</td></tr><tr><td>A2</td><td>C2</td><td>Supp</td></tr><tr><td>A6</td><td>C2</td><td>Basic</td></tr></table>	A1	C1	Basic	A2	C1	Supp	A3	C1	Supp	A4	C1	Supp	A5	C1	Supp	A2	C2	Supp	A6	C2	Basic	
A1	C1	Basic																						
A2	C1	Supp																						
A3	C1	Supp																						
A4	C1	Supp																						
A5	C1	Supp																						
A2	C2	Supp																						
A6	C2	Basic																						
19 Feb 2025	Customer Scoring : Ratio Rules Logic	- Walked through the existing logic for Transaction Amount Ratio and Transaction Count Ratio rules. The rules will follow the POD flow in POA as well. - Walked through the existing logic for Income Spend Ratio Rule. There is a requirement to add a check on the Total Spend Amount parameter prior to the Rule Evaluation. The same needs to be further discussed. - There needs to be further discussion to clarify whether there should be default scoring or no scoring at all in case of no accounts under a customer passing the TOG Indicator/ Product Type parameters. - Default Multiplier Flag : Today, we have no indicator highlighting whether an Element such as Geography was scored high due to the Account having a high risk Geography or via the Default Scoring in case of no Geography Data. There is therefore a need to have a Flag indicating the basis of the same. - The requirement for Audit history before sandbox test run was discussed. No need for it exists. - The Rollback Capability requirement in the BRD needs to be revisited after internal discussions. - Tommy will provide an update regarding the BIA Tier for POA CRR Application. - Open Question- For income spend ratio rule, currently all the transactions are rolled up to Basic account, meaning we dont consider supps for these rules. So, going forward should we keep it this way or are we planning to change that																						

26 Feb 2025	• Income Spend Ratio Rules • BIA Tier • Global Customer ID vs Cust XREF ID • Market v/s Centre • Product type • Sandbox Adhoc Questions	Income Spend Ratio Rules: • The decision whether we need to use Default or no multiplier when the rules are not passing the TOG/Product Type Parameter is still underway. • The filter on Income Spend Amount should be configurable from the UI end. • Additionally we need to use existing data point (Transaction Amount) for adding the income spend check as part of rule evaluation and the same shall be optional while configuring the rule • Currently we are rolling up transactions for supplement accounts with the TOG account, however for POA CRR the decision whether we need to introduce any changes in order to include Sup accounts is still yet to be decided. Tommy will be discussing the same with Darren. • For MVP1 POA CRR we will be considering the transactions only for 'CARD' products. BIA Tier: • Tommy will provide an update regarding the BIA Tier for POA CRR Application. Global Customer ID vs Cust XREF ID: • Still more discussion and clarity is required on global cust id and xref cust id data. • Follow-up call will be setup with Saksham and Saumya on the same, before designing the approach . Market v/s Centre: • The decision has been made by EMEA team and we will be using market going forward at all places where originally centre code was being used . • Basically we won't keeping any centre data like X1, X2,D0 in GCIP, instead we will having native market/country information where the account has been issued or is located in. Product type: • We need to discuss with DAM and understand how they are currently organizing product data and if it is more oriented on a LOB level like consumer, sbs , corporate. • Accordingly we will have to assess the potential impacts of the same on our cadence process like MLRA and Edd scheduling • Discussion with DMO should be taken up in the upcoming days to get clarity on the same. Sandbox Adhoc Questions: • Can there be requirement in POA CRR where we don't make any rule changes while creating a SBX but just want to see the results by executing all the rules. --> Tommy will get back to us on the same post discussion with Jake. • When an Enterprise SBX is submitted, we would be fetching the entire customer population. While evaluating if there is a market specific Rule, that would be applied based on Acct/Cust market else the Enterprise Rule will be applicable. • In case of market specific SBX, we fetch only the respective markets Cust/Accts and apply the market specific rules. In case there is no market specific rule, then the enterprise rule rating would be fetched from the production assessment.	
05 Mar 2025	• BIA Tier • Market v/s Centre • Income Spend Ratio Rule	BIA Tier: • Tommy will provide an update regarding the BIA Tier for POA CRR Application. Market v/s Centre: • The decision has been made by EMEA team and we will be using market going forward at all places where originally center code was being used . • Tommy needs to reach out to Tori for written confirmation on the same. Income Spend Ratio Rule: • The decision whether we need to use Default or no multiplier when the rules are not passing the TOG/Product Type Parameter is still underway • Currently we are rolling up transactions for supplement accounts with the TOG account, however for POA CRR the decision whether we need to introduce any changes to include Sup accounts is still yet to be decided. Tommy will be discussing the same with Darren. • Need another round of discussion for Income Spend Ratio Rule to clear some doubts	

12 Mar 2025	• "Transaction Country" & "Transaction Origin Country" • Income spend ratio rule walkthrough • Open questions/doubts on income spend ratio and Aggregation rule • Open question-Do we need the data point attribute along with the customer risk rating? If yes, do we also need to populate CM13 and all attributes of the rule, or just the primary attribute?	• Income Spend ratio Rule Walkthrough: ◦ We need not score the accounts under a customer in case they are not passing the TOG/Product Type Parameter. ◦ Another ruleset will be added within the same element ID of the income spend ratio rule. This new ruleset will retain the same values for the secondary data points and will evaluate whether the transaction amount is less than the configurable transaction amount. If this condition is met, it will set the multiplier as 0. • Tahcin will confirm with the DAM team: ◦ Whether the SUPP's transactions are being rolled up to the Basic's Transaction Amount, or it only includes the Basic's spends ◦ Does DAM have the income amount stored in local currency or USD, so that we can integrate a conversion logic in our code accordingly. • It was confirmed that there will be NO SCENARIO where two different types of Sum /Counts (like trans country count and alert count) will be used simultaneously in one rule set. • With reference to the points raised by Gopesh about Transaction origin country Vs the transaction country, Tommy confirmed that there needs to be no change to the logic on how we are capturing the country currently as this discussion is required to be done at higher level with teams such as transaction monitoring and GFCC as a whole , in order to have a consistent approach. • During the customer risk scoring, there is a requirement to display the account which is driving/contributing to the customer's final risk rating. In case of multiple accounts being the driving factor, there needs to a discussion on what should be displayed- the oldest account or all the driving accounts, keeping in mind the UI limitations. Satvik and Tommy to further refine this requirement and it will be taken up as a separate Feature with more details. • For the time-based rules, the checkbox will be provided to the users for whether or not they want to make it a time based rule, and there will be further internal discussion among the business to decide if the time period for the same will be configurable.	
23 Apr 2025	• Sandbox Simulation • Time Based Rules	Sandbox Simulation - • New Sandbox would be created at the very first time(Since there won't be any Production Assessment, hence it can't be a copy of Production). • Going forward, each Sandbox will be copy of the Single CRR Production Assessment. • Once a sandbox is created and submitted (say version v1) and it's modified afterwards to create a new version (say v2) from v1 without merging into production, then newer version will be compared to Production Assessment only. • Copies of the SBX assessment won't be created, only the changes can be made to an existing version to create a newer version. • If there is some change (add/edit/delete) in a Rule Set of a Risk Element, that Risk Element would be evaluated in the Sandbox run and Risk Rating of other Risk Elements would be fetched from the Production Assessment. • If the Risk Element is deleted, Risk Rating for that Risk Element would be removed in the Risk Aggregation module and the rating for other Risk Elements would be calculated. Time Based Rules - • Jake to provide an update after confirming with Tommy -- Will the TB elements be part of the Risk Element Change execution? - It might be and we need to execute it immediately. • It is not needed to score the Time Based elements in case of new account/customer onboarding.	
30 Apr 2025	• Customer Linkage Logic • Time Based Rules • CRR Output Variables	• We can have different Data Points for respective Foreign Indicator usage like Transaction & Geography Rules. • Discussed on addition of a screen for new Data Point addition with proper approval workflows & data quality checks. We would need further refinement on this feature for future PIs. • Reviewed the Customer Linkage Logic (Derivation of CUST_XREF_ID) with Tommy. Reference Sheet - 20241111_EDD_Redefined_Hierarchies.xlsx • Discussed on how the attributes should be used for CRR Scoring based on the CUST_XREF_ID. Tommy mentioned he would check internally and get back on this. • Further discussion is required on the execution of Time Based Rules with Gopesh & Tommy. • Reviewed the initial list of Output Variables (CRR Output Variables.xlsx) with Tommy.
